AB The vibrofluidized bed developed consisting of a transparent plexiglass tube with an inner diameter of 0.1 m and a height of 0.5 m, was designed for the fluidization of adipic acid. The fluidization behavior of dry adipic acid with particle diams. in the range of 75 - 600 µm and a d. of 1340kg/m3 was studied using mech. vibration for different sample loads. Variables studied for the wet material **include** frequency and amplitude of vibration and moisture content of the particles. On the basis of the quant. flow curve data and visual observations, it is concluded that the fluid dynamics of the bed with wet sticky particles, both vibrating and not vibrating, is different from that of the bed with dry particles.

AB A simple and easy technique is proposed for the preparation of dry hexamethylenediammonium adipate (HMA salt), using conventional dry-blending equipment. The process **includes** contacting adipic acid and hexamethylenediamine in the presence of a cryogenic medium (solid CO2 or liquid N2), which is used to depress the exotherm of the salt formation. The purpose is the formation of free-flowing HMA salt with good homogeneity and balanced end groups. Critical parameters were studied, such as the nature and amount of cryogenic agent and the presence of water

traces in the reacting mixture Application in an industrial scale seems feasible so that all advantages of handling dry HMA salt instead of its components (adipic acid powder and hexamethylenediamine liquid) can be utilized for the subsequent production of nylon 66.
